# <sup>N</sup>JURNISTA<sup>®</sup>

HYDROmorphine hydrochloride

Prolonged-Release Tablets  
4, 8, 16, and 32 mg

Opioid Analgesic

## PART I: HEALTH PROFESSIONAL INFORMATION

### SUMMARY PRODUCT INFORMATION

Route of Administration	Dosage Form / Strength	Nonmedicinal Ingredients
Oral	Prolonged-Release Tablet 4 mg, 8 mg, 16 mg, and 32 mg	butyl hydroxytoluene, cellulose acetate, glycerol triacetate (8 mg, 16 mg and 32 mg only), iron oxide black, ferric oxide red (4 mg and 8 mg only), ferric oxide yellow (4 mg, 16 mg and 32 mg only), hypromellose, lactose anhydrous, lactose monohydrate (8 mg, 16 mg and 32 mg only), macrogol, magnesium stearate, polyethylene oxide, povidone, propylene glycol, sodium chloride and titanium dioxide.  JURNISTA <sup>®</sup> may contain traces of sodium metabisulfite.

### INDICATIONS AND CLINICAL USE

#### Adults

JURNISTA<sup>®</sup> (HYDROmorphine hydrochloride) is indicated for the management of pain severe enough to require daily, continuous, long-term opioid treatment, and:

- that is opioid-responsive; and
- for which alternative options are inadequate.

JURNISTA<sup>®</sup> is not indicated as an as-needed (prn) analgesic.

### **Geriatrics (> 65 years of age)**

In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, concomitant disease or other drug therapy. The elderly are more prone to central nervous system (CNS) adverse effects (see **DOSAGE AND ADMINISTRATION**).

### **Pediatrics (< 18 years of age)**

The safety and efficacy of JURNISTA<sup>®</sup> have not been studied in the pediatric population. Therefore, the use of JURNISTA<sup>®</sup> in patients under 18 years of age is not recommended.

## **CONTRAINDICATIONS**

JURNISTA<sup>®</sup> (HYDROMORPHONE hydrochloride) is contraindicated in:

- Patients who are hypersensitive to this drug or to any ingredient in the formulation or component of the container. For a complete listing of excipients, see the **DOSAGE FORMS, COMPOSITION AND PACKAGING** section of the Product Monograph.
- Patients who have had surgical procedures and/or underlying disease that may result in narrowing of the gastrointestinal tract, or have “blind loops” of the gastrointestinal tract or gastrointestinal obstruction.
- Patients who have ileus of any type.
- Patients with suspected surgical abdomen (e.g., acute appendicitis or pancreatitis).
- Patients with mild, intermittent or short duration pain that can otherwise be managed.
- The management of acute pain.
- The management of perioperative pain.
- Patients with acute asthma or other obstructive airway, and status asthmaticus.
- Patients with acute respiratory depression, elevated carbon dioxide levels in the blood, and cor pulmonale.
- Patients with acute alcoholism, delirium tremens, and convulsive disorders.
- Patients with severe CNS depression, increased cerebrospinal or intracranial pressure, and head injury.
- Patients taking monoamine oxidase (MAO) inhibitors (or within 14 days of such therapy).
- Women during breastfeeding, pregnancy, labour and delivery.

## WARNINGS AND PRECAUTIONS

### SERIOUS WARNINGS AND PRECAUTIONS

#### Limitations of Use

Because of the risks of addiction, abuse, and misuse with opioids, even at recommended doses, and because of the greater risks of overdose and death with extended-release opioid formulations, JURNISTA<sup>®</sup> should only be used in patients for whom alternative treatment options are ineffective or not tolerated (e.g., non-opioid analgesics), or would be otherwise inadequate to provide sufficient management of pain (e.g., immediate-release opioids) (see DOSAGE AND ADMINISTRATION).

#### Addiction, Abuse, and Misuse

JURNISTA<sup>®</sup> poses risks of opioid addiction, abuse, and misuse, which can lead to overdose and death. Each patient's risk should be assessed prior to prescribing JURNISTA<sup>®</sup>, and all patients should be monitored regularly for the development of these behaviours or conditions (see WARNINGS AND PRECAUTIONS). JURNISTA<sup>®</sup> should be stored securely to avoid theft or misuse.

#### Life-threatening Respiratory Depression

Serious, life-threatening, or fatal respiratory depression may occur with use of JURNISTA<sup>®</sup>. Patients should be monitored for respiratory depression, especially during initiation of JURNISTA<sup>®</sup> or following a dose increase. JURNISTA<sup>®</sup> should be swallowed whole; crushing, chewing, or dissolving JURNISTA<sup>®</sup> tablets can cause rapid release and absorption of a potentially fatal dose of HYDROMorphone hydrochloride (see WARNINGS AND PRECAUTIONS).

#### Accidental Exposure

Accidental consumption of even one dose of JURNISTA<sup>®</sup>, especially by children, can result in a fatal overdose of HYDROMorphone hydrochloride (see DOSAGE AND ADMINISTRATION subsection Disposal, for instructions on proper disposal).

#### Neonatal Opioid Withdrawal Syndrome

Prolonged maternal use of JURNISTA<sup>®</sup> during pregnancy can result in neonatal opioid withdrawal syndrome, which may be life-threatening (see WARNINGS AND PRECAUTIONS).

#### General

JURNISTA<sup>®</sup> should be prescribed only by healthcare professionals who are knowledgeable in the use of potent opioids for the management of chronic pain.

Tablet strengths of 16 mg or higher are only for opioid tolerant patients requiring HYDROMorphone equivalent dosages of 16 mg or higher per day. These doses may lead to severe medical consequences, including fatal respiratory depression, in patients not previously exposed to similar daily doses of opioids at the time of switching to JURNISTA<sup>®</sup>.

JURNISTA<sup>®</sup> is for continuous opioid coverage, given once a day in patients who require treatment for several days or more. Because it may be more time consuming to titrate a patient not routinely taking opioids to adequate analgesia using a controlled-release opioid preparation, it is advisable to have patients titrated to a satisfactory level of pain relief with an immediate-release opioid prior to conversion to the appropriate total daily dose of JURNISTA<sup>®</sup>.

Patients who have received JURNISTA<sup>®</sup> should be closely monitored, especially for signs of respiratory depression, until a stable maintenance dose is reached. Since alcohol increases the sedative effect of opioids, the concomitant use of JURNISTA<sup>®</sup> and alcohol should be avoided.

### **Gastrointestinal**

#### **Potential for Gastrointestinal Obstruction**

Because the JURNISTA<sup>®</sup> tablet is non-deformable and does not appreciably change in shape in the gastrointestinal (GI) tract, JURNISTA<sup>®</sup> should not be administered to patients with pre-existing severe GI narrowing (pathologic or iatrogenic, for example: esophageal motility disorders, small bowel inflammatory disease, “short gut” syndrome due to adhesions or decreased transit time, past history of peritonitis, cystic fibrosis, chronic intestinal pseudo-obstruction, or Meckel’s diverticulum) or in patients with dysphagia or significant difficulty in swallowing tablets.

There have been very rare reports of obstructive symptoms in patients with known strictures in association with the ingestion of medicinal products in non-deformable controlled-release formulations (see **ADVERSE REACTIONS**).

#### **Constipation**

JURNISTA<sup>®</sup> causes a reduction in gastrointestinal motility associated with an increase in smooth muscle tone. Constipation is a frequent side effect reported with opioid treatment. Patients should be advised on measures to prevent constipation and prophylactic laxative use should be considered. Extra caution should be used in patients with chronic constipation.

#### **Gastrointestinal Transition**

Clinical conditions or medical products that cause a sudden and significant shortening of gastrointestinal transit time may result in decreased HYDROMORPHONE absorption from JURNISTA<sup>®</sup> and may potentially lead to withdrawal symptoms in patients with a physical dependence on opioids. Appropriate coverage with an immediate-release opioid formulation should be considered.

Due to the controlled-release design, JURNISTA<sup>®</sup> tablets should only be used in patients who are able to swallow the tablets whole. The JURNISTA<sup>®</sup> tablet is non-deformable and does not appreciably change in shape in the GI tract. Patients should be advised that the depleted JURNISTA<sup>®</sup> shells are excreted in their stool in the original shape.

#### **Acute Abdominal Conditions**

The administration of opioids may obscure the diagnosis or clinical course of acute abdominal conditions. Therefore, it is important to make sure that the patient is not suffering from intestinal occlusion, including ileus, before initiation of treatment.

### **Addiction, Abuse and Misuse**

JURNISTA<sup>®</sup> is a potential drug of abuse and misuse, which can lead to overdose and death. Therefore, JURNISTA<sup>®</sup> should be prescribed and handled with caution.

Patients should be assessed for their clinical risks for opioid abuse or addiction prior to being prescribed opioids. All patients receiving opioids should be routinely monitored for signs of misuse and abuse.

Opioids, such as JURNISTA<sup>®</sup>, should be used with particular care in patients with a history of alcohol and illicit/prescription drug abuse. However, concerns about abuse, addiction, and diversion should not prevent the proper management of pain.

### **Dependence/Tolerance**

As with other opioids, tolerance and physical dependence may develop upon repeated administration of JURNISTA<sup>®</sup> and there is a potential for development of psychological dependence.

Physical dependence and tolerance reflect the neuroadaptation of the opiate receptors to chronic exposure to an opiate, and are separate and distinct from abuse and addiction. Tolerance, as well as physical dependence, may develop upon repeated administration of opioids, and are not by themselves evidence of an addictive disorder or abuse.

Patients on prolonged therapy should be tapered gradually from the drug if it is no longer required for pain control. Withdrawal symptoms may occur following abrupt discontinuation of therapy or upon administration of an opioid antagonist.

The opioid abstinence or withdrawal syndrome is characterized by some or all of the following: restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, piloerection, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate.

JURNISTA<sup>®</sup> should be used with caution in patients with alcoholism and other drug dependencies, due to the increased frequency of opioid tolerance and psychological dependence observed in these patient populations. With abuse by parenteral route, the tablet excipients may cause lethal complications (see **TOXICOLOGY**).

### **Cardiovascular**

**Hypotension:** Opioid analgesics, including HYDROMORPHONE, may cause severe hypotension in an individual whose ability to maintain blood pressure is compromised because of lower blood volume or concomitant administration of drugs such as phenothiazines or general anesthetics (see **DRUG INTERACTIONS, Drug-Drug Interactions**).

### **Endocrine and Metabolism**

JURNISTA<sup>®</sup> should be administered with caution and in reduced dosages in patients with adrenocortical insufficiency, myxedema, and hypothyroidism.

## **Genitourinary**

JURNISTA<sup>®</sup>, like all opioid analgesics, should be administered with caution and in reduced dosages in patients with prostatic hypertrophy or urethral stricture.

## **Hepatic/Biliary/Pancreatic**

Patients with moderate hepatic insufficiency should be started on a reduced JURNISTA<sup>®</sup> dose and be closely monitored. If indicated, great caution and careful monitoring should be exercised for patients with severe hepatic insufficiency (see **DOSAGE AND ADMINISTRATION**).

Opioids can cause an increase in biliary tract pressure as a result of spasm in the sphincter of Oddi. Caution should, therefore, be exercised in the administration of JURNISTA<sup>®</sup> to patients with inflammatory or obstructive bowel disorders, or acute pancreatitis secondary to biliary tract disease, and in patients about to undergo biliary surgery.

## **Neurologic**

### **Interactions with Central Nervous System Depressants (including alcohol and illegal drugs):**

JURNISTA<sup>®</sup> should be used with caution and in a reduced dosage during concomitant administration of other opioid analgesics, general anesthetics, phenothiazines and other tranquilizers, sedative/hypnotics, tricyclic antidepressants, antipsychotics, antihistamines, benzodiazepines, centrally-active anti-emetics and other CNS depressants including alcohol and illegal drugs. Respiratory depression, hypotension and profound sedation, coma or death may result. When such combination therapy is contemplated, prescribe the lowest effective dosages and minimum duration for both drugs. Patients should be carefully monitored for signs of respiratory depression and sedation (see **DRUG INTERACTIONS**).

**Head Injury and Increased Intracranial Pressure:** The respiratory depressant effects of opioids with carbon dioxide retention and secondary elevation of cerebrospinal fluid pressure may be markedly exaggerated in the presence of head injury or raised intracranial pressure. Opioids produce effects that may obscure neurological signs of further increases in intracranial pressure in patients with head injuries. JURNISTA<sup>®</sup> should only be administered under such circumstances when it is considered essential and then with extreme caution, and is contraindicated in patients with increased cerebrospinal or intracranial pressure, and head injury (see **CONTRAINDICATIONS**).

### **Neonatal Opioid Withdrawal Syndrome (NOWS)**

Prolonged maternal use of opioids during pregnancy can result in withdrawal signs in the neonate. Neonatal opioid withdrawal syndrome, unlike opioid withdrawal syndrome in adults, may be life-threatening.

Neonatal opioid withdrawal syndrome presents as irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea and failure to gain weight. The onset, duration, and severity of neonatal opioid withdrawal syndrome vary based on the specific opioid

used, duration of use, timing and amount of last maternal use, and rate of elimination of the drug by the newborn.

Use of JURNISTA<sup>®</sup> is contraindicated in pregnant women (see **CONTRAINDICATIONS**).

### **Perioperative Considerations**

JURNISTA<sup>®</sup> is contraindicated for perioperative pain relief. In the case of planned chordotomy or other pain-relieving operations, patients should not be treated with JURNISTA<sup>®</sup> within 24 hours before or after the operation. Thereafter, if JURNISTA<sup>®</sup> is to be continued after the patient recovers from the postoperative period, a new dosage should be administered in accordance with the changed need for pain relief. The risk of withdrawal in opioid-tolerant patients should be addressed as clinically indicated (see **DOSAGE AND ADMINISTRATION, Discontinuation of Treatment**).

The administration of analgesics in the perioperative period should be managed by health care providers with adequate training and experience (e.g., by an anesthesiologist).

### **Psychomotor Impairment**

HYDROMORPHONE may impair the mental and/or physical ability required for the performance of potentially hazardous tasks such as driving a car or operating machinery. This is particularly likely at the start of therapy, following an increase in dose or change of preparation. Patients should be advised not to drive a car or operate machinery unless they are tolerant to the effects of JURNISTA<sup>®</sup>.

### **Renal**

Patients with moderate renal insufficiency should be started on a reduced JURNISTA<sup>®</sup> dose and closely monitored during dose titration. In patients with severe renal insufficiency, an increased dosing interval should also be considered and these patients should, in addition, be monitored during maintenance therapy for development of opioid-related adverse reactions (see **DOSAGE AND ADMINISTRATION**).

### **Respiratory Depression**

Serious, life-threatening, or fatal respiratory depression has been reported with the use of opioids, even when used as recommended. Respiratory depression from opioid use, if not immediately recognized and treated, may lead to respiratory arrest and death. Carbon dioxide (CO<sub>2</sub>) retention from opioid-induced respiratory depression can exacerbate the sedating effects of opioids.

While serious, life-threatening, or fatal respiratory depression can occur at any time during the use of JURNISTA<sup>®</sup>, the risk is greatest during the initiation of therapy or following a dose increase. Patients should be closely monitored for respiratory depression when initiating therapy with JURNISTA<sup>®</sup> and following dose increases.

Severe pain antagonizes the respiratory-depressant effects of opioids. However, should pain suddenly subside, these effects may rapidly become manifest. Patients who are scheduled for regional anesthetic procedures or other interruptions of pain transmission pathways should not receive JURNISTA<sup>®</sup> within 24 hours of the procedure. Concomitant administration of HYDROmorphone with other opioid analgesics is associated with an increased risk of respiratory failure. Therefore, it is important to reduce the dose of HYDROmorphone when other analgesics are given concomitantly.

To reduce the risk of respiratory depression, proper dosing and titration of JURNISTA<sup>®</sup> are essential (see **DOSAGE AND ADMINISTRATION**). Overestimating the JURNISTA<sup>®</sup> dose when converting patients from another opioid product can result in fatal overdose with the first dose.

### **Sensitivity/Resistance**

#### **Galactose Intolerance**

Lactose is a non-medicinal ingredient in JURNISTA<sup>®</sup>. Patients with rare hereditary diseases of galactose intolerance (galactosemia or glucose-galactose malabsorption) should not take this medicine.

#### **Sulfite Allergy**

JURNISTA<sup>®</sup> may contain traces of sodium metabisulfite, a sulfite that may cause allergic-type reactions including anaphylactic symptoms and life-threatening or less severe asthmatic episodes in certain susceptible people. The overall prevalence of sulfite sensitivity in the general population is unknown and probably low. Sulfite sensitivity is seen more frequently in asthmatic than in non-asthmatic people.

### **Patient Counselling Information**

A patient information sheet is included in the package of JURNISTA<sup>®</sup> tablets dispensed to the patient.

Patients receiving JURNISTA<sup>®</sup> should be given the following instructions by the physician:

1. Patients should be informed that accidental ingestion or use by individuals (including children) other than the patient for whom it was originally prescribed, may lead to severe, even fatal, consequences.
2. Patients should be advised that JURNISTA<sup>®</sup> contains HYDROmorphone, an opioid pain medicine.
3. Patients should be advised that JURNISTA<sup>®</sup> should only be taken as directed. The dose of JURNISTA<sup>®</sup> should not be adjusted without consulting with a physician or other healthcare professional.
4. JURNISTA<sup>®</sup> should be swallowed whole (not crushed, divided, or chewed) due to a risk of fatal HYDROmorphone overdose.

5. Patients should not combine JURNISTA<sup>®</sup> with alcohol or other central nervous system depressants (sleep aids, tranquilizers) because dangerous additive effects may occur resulting in serious injury or death.
6. Patients should be advised to consult their physician or pharmacist if other medications are being used or will be used with JURNISTA<sup>®</sup>.
7. Patients should be advised that if they have been receiving treatment with JURNISTA<sup>®</sup> and cessation of therapy is indicated, it may be appropriate to taper the JURNISTA<sup>®</sup> dose, rather than abruptly discontinue it, due to the risk of precipitating withdrawal symptoms.
8. Patients should be advised of the most common adverse reactions that may occur while taking JURNISTA<sup>®</sup>: constipation, nausea, vomiting, somnolence, headache and dizziness.
9. Patients should be advised that JURNISTA<sup>®</sup> may cause drowsiness, dizziness, or lightheadedness and may impair the mental and/or physical ability required for the performance of potentially hazardous tasks (e.g., driving, operating machinery). Patients started on JURNISTA<sup>®</sup> or patients whose dose has been adjusted should be advised not to drive a car or operate machinery unless they are tolerant to the effects of JURNISTA<sup>®</sup>.
10. As with other opioids, patients taking JURNISTA<sup>®</sup> should be advised of the potential for constipation; patients should be advised on measures to prevent constipation and prophylactic laxative use should be considered.
11. Patients should be advised that JURNISTA<sup>®</sup> is a potential drug of abuse. They should protect it from theft or misuse.
12. Patients should be advised that JURNISTA<sup>®</sup> should never be given to anyone other than the individual for whom it was prescribed.
13. Patients should be advised that JURNISTA<sup>®</sup> 16 mg or higher is for use only in opioid-tolerant patients.

### **Special Populations**

**Pregnant Women:** Prolonged maternal use of opioids during pregnancy can result in withdrawal signs in the neonate. Neonatal opioid withdrawal syndrome, unlike opioid withdrawal syndrome in adults, may be life-threatening (see **WARNINGS AND PRECAUTIONS, Neonatal Opioid Withdrawal Syndrome**).

JURNISTA<sup>®</sup> is contraindicated during pregnancy, labour and delivery due to impaired uterine contractility and the risk of neonatal respiratory depression. No clinical data on pregnant women exposed to JURNISTA<sup>®</sup> are available. While studies in rats and rabbits have revealed no teratogenic effects, reproductive toxicity has been observed.

HYDROMORPHONE has been shown to cross the placental barrier in experimental animals. The

potential teratogenic risk for humans from the use of HYDROmorphine and other opiates during pregnancy is unknown. Withdrawal symptoms may be observed in the newborn of mothers undergoing chronic opioid treatment (see **CONTRAINDICATIONS**).

**Nursing Women:** Preclinical studies have shown that HYDROmorphine can be detected in the milk of lactating rats. Low concentrations of HYDROmorphine and other opioid analgesics have been detected in human milk in clinical studies. JURNISTA<sup>®</sup> should not be used during breast-feeding (see **CONTRAINDICATIONS**).

**Pediatrics (< 18 years of age):** The use of JURNISTA<sup>®</sup> in children under 18 years of age is not recommended, as the safety and efficacy of JURNISTA<sup>®</sup> have not been studied in the pediatric population.

**Geriatrics (> 65 years of age):** In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, concomitant disease or other drug therapy (see **DOSAGE AND ADMINISTRATION**). The elderly are more prone to central nervous system (CNS) adverse effects. Concomitant use of other medications, especially tricyclic antidepressants, increases the risk of confusion and constipation. Diseases of the prostate gland and the urinary tract are often seen in the elderly. This contributes to the increased risk of urinary retention.

## **ADVERSE REACTIONS**

### **Adverse Drug Reaction Overview**

The most common adverse reactions related to JURNISTA<sup>®</sup> were opioid-related gastrointestinal events of constipation, nausea, and vomiting, and opioid-related nervous system events of somnolence, headache, and dizziness.

The most serious adverse reaction associated with opioid therapy is respiratory depression. Use of an opioid dose that is higher than the opioid tolerance level of the patient may lead to fatal respiratory depression. Respiratory depression due to overexposure may be more likely in certain subgroups of patients, such as in the elderly, in the debilitated, and in those suffering from conditions accompanied by hypoxia or hypercapnia when even moderate doses may lead to fatal respiratory depression (see **WARNINGS AND PRECAUTIONS**).

### **Clinical Trial Adverse Drug Reactions**

*Because clinical trials are conducted under very specific conditions the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.*

The safety of JURNISTA<sup>®</sup> was evaluated from the safety data of 13 studies in chronic pain. The 13 studies were conducted in patients with cancer pain and non-malignant pain, including

osteoarthritis (OA) pain and low back pain. In total, 2335 patients had received JURNISTA<sup>®</sup> for pain treatment.

### **Placebo-Controlled Studies**

The placebo-controlled safety database for JURNISTA<sup>®</sup> contains 268 patients with chronic low back pain, and 981 patients with osteoarthritis pain.

#### Low Back Pain

The study in chronic low back pain was a 12-week double-blind placebo-controlled, randomized withdrawal study with flexible dosing. A total of 447 patients were enrolled into the open-label titration phase with 268 patients randomized into the double-blind treatment phase. In the open-label phase, patients were converted to and titrated to a stable dose with JURNISTA<sup>®</sup>.

At the beginning of the double-blind phase, patients were randomized (in a 1:1 ratio) to either JURNISTA<sup>®</sup> or the matching placebo dosage, administered daily for up to 12 weeks. Patients who were randomized to placebo received JURNISTA<sup>®</sup> in dosages tapering from their stable Conversion and Titration phase dosage to placebo over a maximum of 14 days.

Overall discontinuation rates during the double-blind phase were 50.7% in JURNISTA<sup>®</sup>-treated patients and 67.2% in placebo-treated patients. There were no occurrences of gastrointestinal obstruction or respiratory depression.

The most common treatment-emergent adverse events ( $\geq 2\%$ ) reported during the titration phase were constipation, diarrhea, dry mouth, nausea, vomiting, drug withdrawal syndrome, fatigue, edema peripheral, arthralgia, back pain, dizziness, headache, somnolence, anxiety, insomnia, hyperhidrosis and pruritus. Table 1.1 summarizes the treatment-emergent adverse events for JURNISTA<sup>®</sup> and placebo-treated patients from the placebo-controlled low back pain study.

**Table 1.1: Treatment-Emergent Adverse Events Reported in a JURNISTA<sup>®</sup> Chronic Pain Trial in Patients with Low Back Pain (≥1% and more frequent than the placebo group)**

	<i>JURNISTA<sup>®</sup></i> % ( <i>n</i> = 134)	<i>Placebo</i> % ( <i>n</i> = 134)
<b>Gastrointestinal disorders</b>

<b>Vascular disorders</b>		
Hypotension	1.5	0

### Osteoarthritis Pain

In the placebo-controlled study with osteoarthritis pain, both opioid naïve and current opioid users were included. The current opioid users were receiving a daily morphine equivalent dose of < 40 mg. All patients were randomly assigned to placebo or a fixed dose of JURNISTA<sup>®</sup> (8 or 16 mg) with no dose adjustments allowed. Overall discontinuation rates were 43.7% (145/332 patients) from placebo treatment, 50.8% (162/319 patients) from the 8 mg treatment, and 61.2% (202/330 patients) from the 16 mg treatment. Adverse events were the predominant reason for discontinuation from active treatment and lack of analgesia was the predominant reason for discontinuation from placebo treatment. Adverse events that led to discontinuation of the active study medication were most frequently the common opioid-related events, constipation, nausea, somnolence, dizziness and headache. No deaths occurred during the study or within 30 days after completion of the study treatments. Table 1.2 summarizes the treatment-emergent adverse events for JURNISTA<sup>®</sup> and

placebo-treated patients from the placebo-controlled study in osteoarthritis pain.

**Table 1.2: Treatment-Emergent Adverse Events Reported in a JURNISTA<sup>®</sup> Chronic Pain Trial in Patients with Osteoarthritis Pain ( $\geq 1\%$  and more frequent than the placebo group)**

## **All Clinical Studies**

The following treatment-emergent adverse reactions were identified premarketing based on pooling the safety data from the 13 studies. Of the 2335 patients who had received JURNISTA<sup>®</sup>, 420 patients were treated with JURNISTA<sup>®</sup> for at least 6 months, while 141 patients were treated with JURNISTA<sup>®</sup> for more than 12 months.

A total of 64 deaths were reported in the 13 studies during or after JURNISTA<sup>®</sup> treatment. Fifty-eight deaths were attributed to cancer and six were associated with other conditions (cardiac arrest in two patients and sepsis, respiratory failure/dehydration, myocardial infarction, and congestive heart failure, each in one patient). All of the deaths were considered unrelated or unlikely related to drug treatment.

Respiratory depression was reported in one patient with cancer pain. The event, which occurred on day 263 of JURNISTA<sup>®</sup> treatment, was considered mild in intensity and definitely related to drug treatment but did not require cessation of JURNISTA<sup>®</sup> treatment. Six gastrointestinal obstructive events were reported: small intestinal obstruction in two patients; and intestinal obstruction, fecaloma, bezoar, and gastric outlet obstruction, each in one patient. All events occurred in the context of predisposing conditions (i.e., pathologic or iatrogenic gastrointestinal narrowing, Crohn's disease, colon cancer, colon resection, colon tortuosity, previous bowel obstruction, gall bladder surgery, gastric ulcer, vagotomy, antrectomy, pyloroplasty, and chronic constipation with chronic laxative abuse). For the bezoar and fecaloma events, there was no evidence of OROS<sup>®</sup> shells in the impacted material.

The most common treatment-emergent adverse reactions related to JURNISTA<sup>®</sup> were opioid-related gastrointestinal events of constipation, nausea, and vomiting, and opioid-related nervous system events of somnolence, headache, and dizziness. The safety profile for JURNISTA<sup>®</sup> is consistent with those of other strong opioids.

### Clinical Trial Treatment-Emergent Adverse Reactions

Following are the treatment-emergent adverse reactions from the 13 JURNISTA<sup>®</sup> studies in patients with chronic pain:

**Table 1.3: Treatment-Emergent Adverse Reactions**

System Organ Class	Treatment-Emergent Adverse Reaction			
	Frequency			
	Very Common (≥10%)	Common (≥1% to <10%)	Uncommon (≥0.1% to 1%)	Rare (≥ 0.01% to 0.1%)
<b>Cardiac disorders</b>		tachycardia	palpitations, extrasystoles	bradycardia
<b>Ear and labyrinth disorders</b>		vertigo	tinnitus	
<b>Endocrine disorders</b>				hypogonadism
<b>Eye disorders</b>		vision blurred	diplopia, dry eye	miosis
<b>Gastrointestinal disorders</b>	constipation, nausea, vomiting	diarrhea, abdominal pain, dry mouth, dyspepsia, dysphagia, flatulence	hematochezia, abdominal distension, hemorrhoids, abnormal feces, intestinal obstruction, diverticulum, eructation, gastrointestinal motility disorder, large intestine perforation	anal fissure, bezoar, duodenitis, ileus, impaired gastric emptying, painful defecation
<b>General disorders and administration site conditions</b>	asthenia	edema, pyrexia, pain, chest discomfort, chills, drug withdrawal syndrome	malaise, feeling abnormal, feeling jittery, difficulty in walking, hangover	feeling drunk, feeling hot and cold, hypothermia
<b>Infections and infestations</b>			gastroenteritis, diverticulitis	
<b>Injury, poisoning and procedural complications</b>		fall, contusion	overdose	
<b>Investigations</b>		weight decreased	oxygen saturation decreased, blood potassium decreased, hepatic enzyme increased, blood amylase increased	blood testosterone decreased
<b>Metabolism and nutrition disorders</b>		anorexia, dehydration	fluid retention, increased appetite, hyperuricemia	
<b>Musculoskeletal and connective tissue disorders</b>		muscle spasms, back pain, arthralgia, pain in extremity	myalgia	
<b>Nervous system disorders</b>	somnolence, headache, dizziness	hypoesthesia, paresthesia, tremor, sedation, memory impairment, disturbance in attention, dysgeusia	dysarthria, syncope, balance disorder, coordination abnormal, depressed level of consciousness, hyperesthesia, dyskinesia, myoclonus, encephalopathy,	hyperreflexia

System Organ Class	Treatment-Emergent Adverse Reaction			
	Frequency			
	Very Common (≥10%)	Common (≥1% to <10%)	Uncommon (≥0.1% to 1%)	Rare (≥ 0.01% to 0.1%)
			cognitive disorder, psychomotor hyperactivity, fits/convulsions	
<b>Psychiatric disorders</b>		insomnia, anxiety, depression, confusional state, nervousness, abnormal dreams, restlessness, hallucination, mood altered	libido decreased, panic attack, euphoric mood, listless, paranoia, aggression, crying, suicide ideation	dysphoria
<b>Renal and urinary disorders</b>		dysuria, urinary retention	pollakiuria, urinary hesitation, micturition disorder	
<b>Reproductive system and breast disorders</b>			erectile dysfunction, sexual dysfunction	
<b>Respiratory, thoracic and mediastinal disorders</b>		dyspnea	rhinorrhea, hypoxia, respiratory distress, bronchospasm, hyperventilation, sneezing	respiratory depression
<b>Skin and subcutaneous tissue disorders</b>		pruritus, hyperhidrosis, rash	erythema	
<b>Vascular disorders</b>		flushing, hypertension	hypotension	

## Post-Market Adverse Drug Reactions

In post-marketing experience, adverse drug reactions such as angioedema, urticaria, and hypersensitivity have been reported very rarely. There have also been post-marketing reports of esophageal reflux aggravated, influenza like illness, skin burning sensation, and sleep disorder.

## DRUG INTERACTIONS

### Overview

The low level of protein binding of HYDROmorphine to human plasma proteins (less than 30%) makes it unlikely to result in protein-displacement drug-drug interactions.

*In vitro* and *in vivo* data suggest that HYDROmorphine in clinical practice has minimal potential to moderate the activity of human hepatic CYP450 activities. Metabolism of HYDROmorphine is predominantly through conjugation with glucuronic acid as a first-pass effect, with no identified active metabolites and with little potential for drug-drug interactions at the level of metabolizing enzymes.

## **Drug-Drug Interactions**

### **CNS Depressants, including alcohol and illegal drugs**

CNS depressants, such as other opioids, general anesthetics, benzodiazepines, sedatives, hypnotics, barbiturates, phenothiazines, other antipsychotics, and glutethimide may enhance the depressant effects of HYDROmorphone. The concomitant use of central nervous system depressants may cause additive depressant effects and respiratory depression. Additionally, hypotension and profound sedation, coma or death may occur. Pyrazolidone antihistamines, beta-blockers, alcohol and illegal drugs may also enhance the depressant effects of HYDROmorphone. When this combination therapy is indicated with these drugs, the dose of one or both agents should be reduced.

JURNISTA<sup>®</sup>, like other opioids, may enhance the neuromuscular blocking action of muscle relaxants and may cause an increased degree of respiratory depression.

The concomitant use of alcohol should be avoided. Alcohol increases the sedative effect of HYDROmorphone.

### **Monoamine oxidase inhibitors**

Monoamine oxidase inhibitors (MAOIs) may cause CNS excitation or depression, hypotension or hypertension if co-administered with opioids. JURNISTA<sup>®</sup> is contraindicated in patients taking MAOIs or within 14 days of stopping such treatment. MAOIs (including procarbazine) should not be taken within two weeks of using JURNISTA<sup>®</sup>.

### **Mixed agonist-antagonist opioid analgesics**

The concomitant use of HYDROmorphone (a pure opioid agonist) with mixed agonist-antagonist opioid analgesics (buprenorphine, nalbuphine, pentazocine) could lead to a reduction of the analgesic effect by competitive blocking of receptors, thus leading to a risk of withdrawal symptoms. Therefore, this combination is not recommended.

### **Alcohol Interaction Studies**

*In vitro* dissolution studies have demonstrated no dose dumping with JURNISTA<sup>®</sup> in the presence of 4%, 20% or 40% alcohol (% v/v) with continuous exposure to alcohol over 24 hours.

The effect of co-administering 240 mL 4-40% alcohol on the pharmacokinetics of HYDROmorphone from a 16 mg JURNISTA<sup>®</sup> tablet was evaluated in healthy subjects. The maximum concentration of HYDROmorphone ( $C_{max}$ ) increased on average between 10 to 31% with the co-administration of alcohol. Median  $T_{max}$  values were similar across treatment groups and there were no effects seen in AUC values (see **ACTION AND CLINICAL PHARMACOLOGY, Pharmacokinetics**).

Co-administration of 240 mL 4%, 20% and 40% alcohol (% v/v) increased  $C_{max}$  on average by 17%, 31% and 28% for 4%, 20% and 40% alcohol respectively in the fasting state;  $C_{max}$  was less affected in the fed state with increases at 14%, 14% and 10%, respectively. The observed variation in  $C_{max}$  is consistent with inter-subject variability associated with the use of immediate-release opioids. Median  $T_{max}$  in the presence/absence of alcohol remains between 12-16 hours. No effect was seen on AUC values both in the fed and fasted state. Due to the OROS<sup>®</sup> technology in JURNISTA<sup>®</sup>, the extended-release properties of JURNISTA<sup>®</sup> are maintained in

the presence of alcohol. However, concomitant use of alcohol should be avoided (see **WARNINGS AND PRECAUTIONS, General**).

### **Drug-Food Interactions**

No effects on the pharmacokinetics of JURNISTA<sup>®</sup> were observed with administration of a high-fat meal. JURNISTA<sup>®</sup> can be taken with or without food.

### **Drug-Herb Interactions**

Interactions with herbal products have not been established.

### **Drug-Laboratory Interactions**

Interactions with laboratory tests have not been established.

### **Drug-Lifestyle Interactions**

The concomitant use of alcohol should be avoided (see **WARNINGS AND PRECAUTIONS, Neurologic**).

## **DOSAGE AND ADMINISTRATION**

**JURNISTA<sup>®</sup> should only be used in patients for whom alternative treatment options are ineffective or not tolerated (e.g., non-opioid analgesics), or would be otherwise inadequate to provide sufficient management of pain (e.g., immediate-release opioids).**

**JURNISTA<sup>®</sup> should be swallowed whole; crushing, chewing, or dissolving JURNISTA<sup>®</sup> tablets can cause rapid release and absorption of a potentially fatal dose of HYDROmorphone (see **WARNINGS AND PRECAUTIONS**).**

### **Dosing Considerations**

- Safe and effective administration of JURNISTA<sup>®</sup> to patients with pain depends upon a comprehensive assessment of the patient. The nature of the pain, as well as the patient's medical and analgesic history will affect the selection of the dose. Owing to the varied response to opioids observed between individuals, it is recommended that all patients be started at the lowest possible dose of opioid therapy and titrated to an adequate level of analgesia, balanced against acceptable adverse reactions. The lowest titration increment for JURNISTA<sup>®</sup> is 4 mg.
- **Tablet strengths of 16 mg and higher are only for opioid-tolerant patients requiring HYDROmorphone equivalent dosages of 16 mg or higher per day. These doses may lead to severe medical consequences, including fatal respiratory depression, in patients not previously exposed to similar daily doses of opioids.**

- Appropriate prophylaxis for known adverse reactions should be considered. For example, the prescription of antiemetics for nausea and vomiting, and an appropriate regimen of bowel management for constipation (stool softeners, laxatives etc.) should be considered.

## **Recommended Dose and Dosage Adjustment**

The controlled-release nature of the formulation allows JURNISTA<sup>®</sup> to be administered once every 24 hours. JURNISTA<sup>®</sup> tablets should be taken at approximately the same time each day with a glass of water.

JURNISTA<sup>®</sup> tablets can be taken with or without food. JURNISTA<sup>®</sup> should not be taken more than once every 24 hours.

### **Dose Initiation**

#### **Patients Currently Not Routinely Receiving Opioids**

Because it takes 13–16 hours for JURNISTA<sup>®</sup> to reach its maximum drug release, it is recommended to begin treatment with a conventional immediate-release preparation (e.g. immediate-release morphine or immediate-release HYDROMORPHONE). Once the patient achieves a steady balance between pain control and adverse reactions, the patient can be converted to the appropriate total daily dose of JURNISTA<sup>®</sup>.

The initial dose in patients who are opioid naïve or receiving low intermittent doses of weak opioid analgesics - less than 40 mg daily oral morphine equivalents - should be 4 mg every 24 hours. If the physician, based on clinical judgement, decides that a higher initial dose is warranted, 8 mg every 24 hours should not be exceeded. The dose may be titrated upwards or downwards, if required, in increments of either 4 or 8 mg depending on response and supplementary analgesic requirements. The dosage should not be titrated more frequently than every fourth dose (for example, if the first dose is given on a Monday, the dosage could be increased no earlier than the fourth dose, on Thursday).

#### **Patients Currently Receiving Opioids Regularly**

**Discontinue all other around-the-clock opioid analgesic medications when JURNISTA<sup>®</sup> therapy is initiated.**

In patients currently taking opioid analgesics regularly, the starting dose of JURNISTA<sup>®</sup> should be based on the prior daily opioid dose, using standard equianalgesic ratios. For opioids other than morphine, first estimate the equivalent total daily dose of morphine, then use Table 1.4 to determine the equivalent total daily dose of JURNISTA<sup>®</sup>.

**Table 1.4: Multiplication Factors for Converting the Daily Dose of Prior Opioids to the Daily Dose of JURNISTA<sup>®a</sup> (mg/day Prior Opioid x Factor = mg/day JURNISTA<sup>®</sup>)**

<b>mg/day of Prior Opioid</b>	<b>Multiplication (factor) to Obtain mg/day of JURNISTA<sup>®</sup></b>
Morphine	0.2
HYDROMORPHONE	1

<sup>a</sup> conversion factors used in JURNISTA<sup>®</sup> clinical trials

No fixed conversion ratio is likely to be satisfactory in all patients, due to individual patient and formulation differences. Therefore, conversion to the recommended starting dose of JURNISTA<sup>®</sup> followed by close patient monitoring and titration is advised.

Immediate-release HYDROMorphone daily dose or converted HYDROMorphone equivalent doses should be rounded down to the closest dose of JURNISTA<sup>®</sup> available, and given once a day.

JURNISTA<sup>®</sup> may be used with usual doses of non-opioid analgesics and analgesic adjuvants.

### **Individualization of Dosage and Maintenance of Therapy**

After the initiation of therapy with JURNISTA<sup>®</sup>, dose adjustments may be necessary to obtain the patient's best balance between pain relief and opioid-related adverse reactions.

If the pain increases in severity or analgesia is inadequate, a gradual increase in dosage may be required. In order to allow the effects of the dose change to stabilize, the dosage should not be increased more frequently than every fourth dose (for example, if the first dose is given on a Monday, the dosage could be increased no earlier than the fourth dose, on Thursday). As a guideline, dosage increases of 25% to 75% of the current daily dose of JURNISTA<sup>®</sup> should be considered for each titration step.

Once patients become stable on a selected once-daily dose of JURNISTA<sup>®</sup>, the dose may be continued for as long as pain relief is necessary. The continued need for around-the-clock opioid therapy and adjustments in therapy should be reassessed periodically as appropriate.

Some patients may require periodic supplemental doses of a short-acting analgesic for "breakthrough" pain. The initial individual supplemental analgesia doses should generally not exceed 10% to 25% of the 24-hour JURNISTA<sup>®</sup> dose.

### Use in Children and Adolescents

JURNISTA<sup>®</sup> is not recommended for use in children and adolescents below age 18 as the safety and efficacy of JURNISTA<sup>®</sup> have not been studied in the pediatric population.

### Use in the Elderly

The medical status of the elderly patient is often complex. Therefore, treatment with JURNISTA<sup>®</sup> should be initiated cautiously at a reduced initial dose (see **WARNINGS AND PRECAUTIONS, Special Populations**).

### Renal Impairment

Following single-dose administration of HYDROMorphone immediate-release tablets, the following results were observed in clinical studies:

- In patients with moderate renal insufficiency (creatinine clearance of 40-60 mL/min), exposure (plasma AUC) to HYDROMorphone was approximately 2 times higher than in those with normal renal function, and elimination half-life was unaltered.

- In patients with severe renal insufficiency (creatinine clearance < 30 mL/min), exposure (plasma AUC) to HYDROmorphone was approximately 4 times greater than in those with normal renal function, and elimination half-life 3 times longer.

Therefore, patients with renal insufficiency should be started on a reduced dose and closely monitored during dose titration. In patients with severe renal insufficiency, an increased dosing interval should also be considered and these patients should, in addition, be monitored during maintenance therapy for development of opioid-related adverse reactions.

### Hepatic Impairment

Following single-dose administration of HYDROmorphone immediate-release tablets, the following results were observed in clinical studies:

- In patients with moderate hepatic insufficiency (scoring 7-9 on Child-Pugh rating scale) both exposure (plasma AUC) and peak plasma concentrations of HYDROmorphone were approximately 4 times higher compared with healthy controls and elimination half-life was unaltered.

Therefore, patients with moderate hepatic insufficiency should be started on a reduced dose and closely monitored during dose titration.

### **Discontinuation of Treatment**

In patients who are physically dependent on opioids and receiving daily administration of HYDROmorphone, abrupt discontinuation of treatment with JURNISTA<sup>®</sup> will result in symptoms of withdrawal syndrome. Therefore, if cessation of therapy with JURNISTA<sup>®</sup> is indicated in patients, a gradual downward titration in small increments, such as in steps of 50%, every 2 days is recommended until the lowest possible dose is reached, at which time therapy may be safely discontinued. If symptoms of withdrawal appear, tapering should be stopped. The dose should be slightly increased until the signs and symptoms of opioid withdrawal disappear. Tapering should then begin again, but with longer periods of time between each JURNISTA<sup>®</sup> dose reduction, or before converting to an equianalgesic dose of another opioid to continue tapering.

### **Missed Dose**

If the patient did not take the regularly scheduled dose of JURNISTA<sup>®</sup>, the patient should be instructed to take the next dose immediately and start a new 24 hour regimen. Patients should be advised not to take extra tablets or a double dose to make up for a missed dose. JURNISTA<sup>®</sup> should be taken once approximately every 24 hours.

### **Administration**

JURNISTA<sup>®</sup> tablets should be swallowed whole with a glass of water, at approximately the same time each day. They should never be chewed, divided, or crushed. JURNISTA<sup>®</sup> may be taken with or without food (see **ACTION AND CLINICAL PHARMACOLOGY, Pharmacokinetics, Absorption**).

The pharmacokinetics of JURNISTA<sup>®</sup> (single dose 16 mg) was not affected by a high-fat meal. Bioequivalence (AUC and C<sub>max</sub>) was demonstrated under fast and fed conditions. Therefore, JURNISTA<sup>®</sup> can be administered with or without food.

### **Disposal**

JURNISTA<sup>®</sup> should be kept in a safe place, out of the sight and reach of children before, during and after use. JURNISTA<sup>®</sup> should not be used in front of children, since they may copy these actions.

Unused or expired JURNISTA<sup>®</sup> should be properly disposed of as soon as it is no longer needed to prevent accidental exposure to others, including children or pets. If temporary storage is required before disposal, a sealed child-proof container, such as a biohazard waste container or a lockable medication box could be obtained from a pharmacy.

**JURNISTA<sup>®</sup> should never be disposed of in household trash.** Disposal via a pharmacy take-back program is recommended.

## **OVERDOSAGE**

<p><b>For management of a suspected drug overdose, contact your regional Poison Control Centre.</b></p>
---

### **Symptoms**

Opioid overdose is characterized by respiratory depression, drowsiness which progresses to stupor and coma, musculoskeletal flaccidity, cold skin, contracted pupils and at times, tachycardia and hypotension. In cases of severe overdose, apnea, circulatory collapse, cardiac arrest and death may occur.

### **Treatment**

In the treatment of overdose, primary attention should be given to the re-establishment of adequate respiratory exchange by keeping the airway open and instituting assisted or controlled ventilation. If oral ingestion was recent, gastric contents may be emptied by gastric lavage, as indicated.

Supportive measures (including oxygen and vasopressors) should be used to manage the shock and pulmonary edema, which potentially accompany overdose. Cardiac arrest and arrhythmias may require cardiac massage or defibrillation.

In cases of severe overdose, specific antidotes such as naloxone should be used to manage respiratory depression (see the prescribing information for the specific opioid antagonist for details of proper use). The effect of naloxone is relatively short; therefore, the patient should be carefully monitored until respiration has stabilized. JURNISTA<sup>®</sup> will release HYDROMORPHONE for approximately 24 hours. This should be taken into account in determining the treatment. Opioid antagonists should not be given in the absence of clinically significant respiratory

depression, or circulatory depression caused by opioids. Opioid antagonists should be administered with caution to patients suspected to be physically dependent on HYDROmorphone, since rapid reversal of an opioid, including HYDROmorphone, may precipitate symptoms of withdrawal.

## **ACTION AND CLINICAL PHARMACOLOGY**

### **Mechanism of Action**

HYDROmorphone, a semi-synthetic morphine derivative, is a hydrogenated ketone of morphine. HYDROmorphone is principally an agonist of  $\mu$ -receptors, showing a weak affinity for  $\kappa$ -receptors. Comparing relative binding affinity for  $\mu$ - and  $\kappa$ -opioid receptors, HYDROmorphone binds more specifically to  $\mu$ -receptors than structurally related morphine. HYDROmorphone produces diverse pharmacological effects by binding to opioid receptors in the CNS and other tissues.

### **Pharmacodynamics**

As with all opioid analgesics, HYDROmorphone exerts its principal pharmacological effects on the CNS and smooth muscle, including the gastrointestinal tract. These effects are expressed and modulated by binding to specific opioid receptors. HYDROmorphone is principally an agonist of  $\mu$ -receptors, showing a weak affinity for  $\kappa$ -receptors. Analgesia occurs as a consequence of the binding of HYDROmorphone to the  $\mu$ -receptors of the CNS. Although estimates vary (from 2 to 10 times), oral HYDROmorphone appears to be approximately 5 times as potent (by weight) as morphine. Respiratory depression occurs principally by direct action on the cerebral respiratory control centres. Opioids may cause nausea and vomiting due to direct stimulation of the chemoreceptor for emesis in the posterior area of the medulla.

### **Pharmacokinetics**

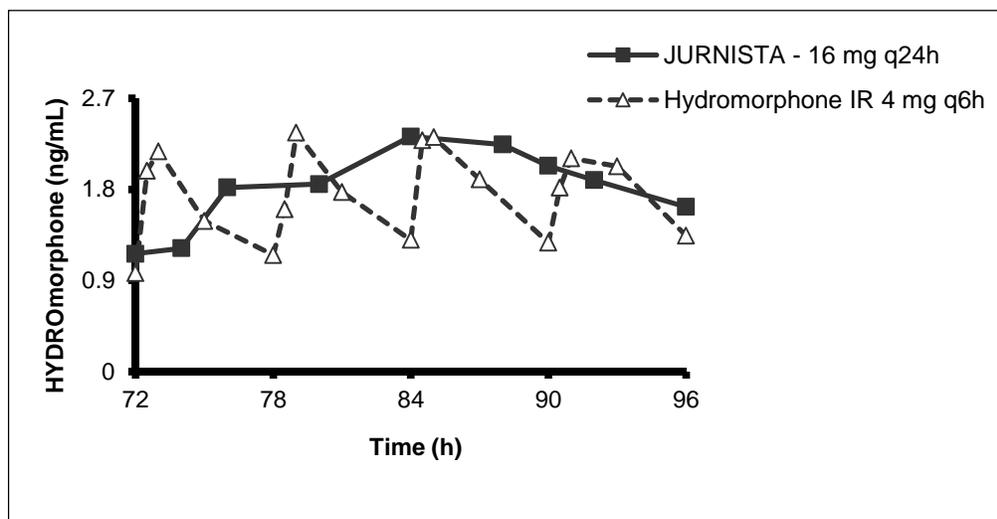

#### **Absorption**

Following a single oral dose of JURNISTA<sup>®</sup> prolonged-release tablets, plasma concentrations gradually increase over 6 to 8 hours, and thereafter concentrations are sustained for approximately 18 to 24 hours post-dose; the mean  $T_{max}$  values were approximately 13 to 16 hours. This demonstrates that HYDROmorphone is released in a controlled manner consistent with once-daily dosing. The mean absolute bioavailability of HYDROmorphone from JURNISTA<sup>®</sup> ranged from 22% to 26%.

Steady-state plasma concentrations are approximately twice those observed following the first dose, and steady state is reached by the fourth dose of JURNISTA<sup>®</sup>. No time-dependent change in pharmacokinetics was seen with multiple dosing. At steady state, JURNISTA<sup>®</sup> given once daily maintained HYDROmorphone plasma concentrations within the same concentration range as the immediate-release tablet given 4 times daily at the same total daily dose, and diminished the periodic fluctuations in plasma levels seen with the immediate-release tablet. The degree of fluctuation in plasma concentration at steady state during a 24-hour period was lower with JURNISTA<sup>®</sup> (83%) as compared to the overall fluctuations of the immediate-release tablet

(147%) (see Figure 1.1). At steady state, HYDROmorphine AUC for JURNISTA<sup>®</sup> is equivalent to that observed for the immediate-release tablet dosed four times daily.

**Figure 1.1**  
Steady-State Plasma HYDROmorphine Concentration-Time Curves

Linear pharmacokinetics has been demonstrated for JURNISTA<sup>®</sup> over the dose range 4 to 64 mg, with a dose-proportional increase in plasma concentrations ( $C_{max}$ ) and overall exposure ( $AUC_{(0-48h)}$  and  $AUC_{(0-inf)}$ ).

Studies with immediate-release HYDROmorphine indicated that food delayed the rate of absorption of HYDROmorphine, resulting in a 25% decrease in  $C_{max}$  and a 24% increase in AUC. The pharmacokinetics of JURNISTA<sup>®</sup> (single dose 16 mg) was not affected by a high-fat meal. Bioequivalence (AUC and  $C_{max}$ ) was demonstrated under fast and fed conditions. Therefore, JURNISTA<sup>®</sup> can be administered with or without food (see **DETAILED PHARMACOLOGY**).

In a study in patients with chronic pain who had been titrated with JURNISTA<sup>®</sup> to control pain, plasma concentrations began to rise about two hours post-dose, achieving maximal values over a broad and sustained time period, similar to that observed with JURNISTA<sup>®</sup> in healthy subjects. Pharmacokinetic/pharmacodynamic analysis indicated that, in general, rising and falling plasma HYDROmorphine concentrations correlated with decreasing and increasing pain, respectively.

In a study comparing HYDROmorphine absorption from JURNISTA<sup>®</sup> taken with no alcohol and taken with 240 mL of 4%, 20% and 40% alcohol,  $C_{max}$  increased on average by 17%, 31%, and 28% respectively in the fasting state and was less affected in the fed state with increases of 14%, 14%, and 10%, respectively. Median  $T_{max}$  (fasted and fed) with 4%, 20% and 40% alcohol was 12-16 hours and with 0% alcohol was 16 hours. No effect was seen on AUC values both in the fed and fasted state. Concomitant use of alcohol should be avoided. Due to the OROS<sup>®</sup> technology in JURNISTA<sup>®</sup>, the prolonged-release properties of JURNISTA<sup>®</sup> are maintained in the presence of alcohol. For the pharmacodynamic interactions (see **WARNINGS AND PRECAUTIONS, General**).

### **Distribution**

The mean extent of binding of HYDROmorphine to human plasma proteins was determined to be < 30% in an *in vitro* study.

### **Metabolism**

Glucuronidation is the main metabolic pathway and the principal metabolite is the inactive HYDROmorphine 3-glucuronide, which follows a similar time course to HYDROmorphine in plasma. Unlike morphine, no active 6-glucuronide metabolite is produced.

First-pass metabolism is rapid and extensive. The elimination half-life for HYDROmorphine is approximately 2 hours.

### **Excretion**

Following a single dose of [<sup>14</sup>C]- HYDROmorphine, HYDROmorphine and total radiolabelled material disappear from the plasma in approximately 8 hours after dosing, indicating relatively rapid clearance of all drug-related material from the plasma.

Most of the administered HYDROmorphine dose is excreted as metabolites, with urine as the major route of excretion, accounting for 75% of the administered dose. Approximately 7% and 1% of the dose are excreted as unchanged HYDROmorphine in urine and feces, respectively.

### **Special Populations and Conditions**

#### **Pediatrics**

Very limited data (in published literature) suggest that the pharmacokinetic profile of HYDROmorphine in children is comparable to that in adults. No clinical studies with JURNISTA<sup>®</sup> have been conducted in children.

#### **Geriatrics**

The effect of age on the single-dose pharmacokinetics of immediate-release HYDROmorphine resulted in a 14% decrease in C<sub>max</sub> and a modest increase (11%) in AUC in elderly subjects compared to young subjects. No difference in T<sub>max</sub> was observed. Greater sensitivity of older individuals cannot be excluded. In general, dose selection for an elderly patient should be cautious, usually starting at the low end of the dosing range, reflecting the greater frequency of decreased hepatic, renal, or cardiac function, and of concomitant disease or other drug therapy in this population (see **DOSAGE AND ADMINISTRATION**).

#### **Gender**

Plasma concentrations and pharmacokinetic parameters following administration of JURNISTA<sup>®</sup> are comparable in male and female subjects.

#### **Race**

Population pharmacokinetic analysis revealed no evidence of race-related differences in the pharmacokinetics of HYDROmorphine following JURNISTA<sup>®</sup> administration.

### **Hepatic Insufficiency**

In studies that used single oral dosing with conventional immediate-release HYDROmorphone tablets, hepatic impairment reduced the first-pass metabolism of HYDROmorphone such that four-fold increases in plasma levels of HYDROmorphone were seen in subjects with moderate hepatic dysfunction. See **DOSAGE AND ADMINISTRATION** for recommendations on dosage.

### **Renal Insufficiency**

Renal impairment affected the pharmacokinetics of HYDROmorphone and its metabolites HYDROmorphone 3-glucuronide and HYDROmorphone 3-sulphate following administration of a single oral dose of the immediate-release tablet. The effects of renal impairment on HYDROmorphone pharmacokinetics were two-fold and four-fold increases in HYDROmorphone bioavailability in moderate and severe impairment, respectively. There were also substantial changes in HYDROmorphone 3-glucuronide elimination kinetics for the severe impairment group, although hemodialysis was effective at reducing plasma levels of both HYDROmorphone and its metabolites. See **DOSAGE AND ADMINISTRATION** for recommendations on dosage.

## **STORAGE AND STABILITY**

JURNISTA<sup>®</sup> HYDROmorphone hydrochloride prolonged-release tablets should be stored between 15 and 25°C.

## **SPECIAL HANDLING INSTRUCTIONS**

N/A

## **DOSAGE FORMS, COMPOSITION AND PACKAGING**

JURNISTA<sup>®</sup> tablets use the oral osmotic pump (OROS<sup>®</sup>) Push-Pull<sup>™</sup> technology to deliver HYDROmorphone by a membrane-controlled, osmotically activated process at a constant, controlled rate over 24 hours. All JURNISTA<sup>®</sup> dosage strengths have qualitatively similar formulations, and are designed to deliver proportionately similar amounts of HYDROmorphone over the 24-hour dosing period.

The JURNISTA<sup>®</sup> tablet is a small, round tablet with HYDROmorphone hydrochloride as the active ingredient. The JURNISTA<sup>®</sup> tablet is composed of a bilayer tablet core surrounded by a semi-permeable membrane, and coloured and clear overcoating.

Each JURNISTA<sup>®</sup> 4 mg prolonged-release tablet contains 4.36 mg and delivers 4 mg HYDROmorphone HCl, equivalent to 3.56 mg HYDROmorphone base. JURNISTA<sup>®</sup> 4 mg is a pale beige, round, biconvex tablet, with 'HM 4' printed in black ink on one side.

Each JURNISTA<sup>®</sup> 8 mg prolonged-release tablet contains 8.72 mg and delivers 8 mg HYDROmorphone HCl, equivalent to 7.12 mg HYDROmorphone base. JURNISTA<sup>®</sup> 8 mg is a red, round, biconvex tablet, with 'HM 8' printed in black ink on one side.

Each JURNISTA<sup>®</sup> 16 mg prolonged-release tablet contains 16.35 mg and delivers 16 mg HYDROmorphone HCl, equivalent to 14.24 mg of HYDROmorphone base. JURNISTA<sup>®</sup> 16 mg is a yellow, round, biconvex tablet, with 'HM 16' printed in black ink on one side.

Each JURNISTA<sup>®</sup> 32 mg prolonged-release tablet contains and delivers 32 mg HYDROmorphone HCl, equivalent to 28.48 mg of HYDROmorphone base. JURNISTA<sup>®</sup> 32 mg is a white, round, biconvex tablet, with 'HM 32' printed in black ink on one side.

The following are the excipients for JURNISTA<sup>®</sup> prolonged-release tablets:

butyl hydroxytoluene, cellulose acetate, glycerol triacetate (8 mg, 16 mg, and 32 mg), iron oxide black, ferric oxide red (4 mg and 8 mg), ferric oxide yellow (4 mg, 16 mg and 32 mg), hypromellose, lactose anhydrous, lactose monohydrate (8 mg, 16 mg, and 32 mg), macrogol, magnesium stearate, polyethylene oxide, povidone, propylene glycol, sodium chloride, and titanium dioxide.

JURNISTA<sup>®</sup> may contain traces of sodium metabisulfite.

JURNISTA<sup>®</sup> prolonged-release tablets are packaged in PVC/Aclar aluminum blisters in cartons of 30 tablets.

## PART II: SCIENTIFIC INFORMATION

### PHARMACEUTICAL INFORMATION

#### Drug Substance

**Proper Name:** HYDROmorphine hydrochloride

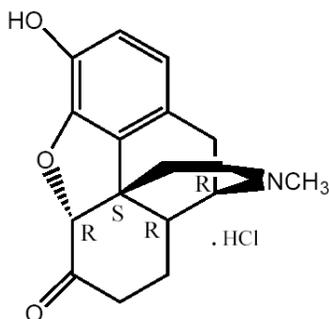

**Chemical Name:** 4,5 $\alpha$ -epoxy-3-hydroxy-17-methylmorphinan-6-one hydrochloride

#### **Molecular Formula and Molecular Mass:**

Molecular formula: C<sub>17</sub>H<sub>19</sub>NO<sub>3</sub>·HCl

Molecular mass: 321.8

#### **Structural Formula:**

#### **Physicochemical properties:**

HYDROmorphine hydrochloride is a white or almost white crystalline powder that is freely soluble in water, very slightly soluble in ethanol (96%) and practically insoluble in methylene chloride. HYDROmorphine hydrochloride has a pKa of 8.1 for the deprotonation of the NH<sup>+</sup> group and a pKa: 9.6 for the deprotonation of the phenolic group.

The specific rotation for HYDROmorphine hydrochloride at 20°C has a range of -136° to -140°.

## CLINICAL TRIALS

JURNISTA<sup>®</sup> was studied in several clinical pain models including patients with cancer pain, osteoarthritis, low back pain, and other non-cancer chronic pain (see **REFERENCES, Clinical**). The safety profile of JURNISTA<sup>®</sup> from these studies was consistent with that of a strong opioid agonist (see **ADVERSE REACTIONS**).

### Placebo-Controlled Studies

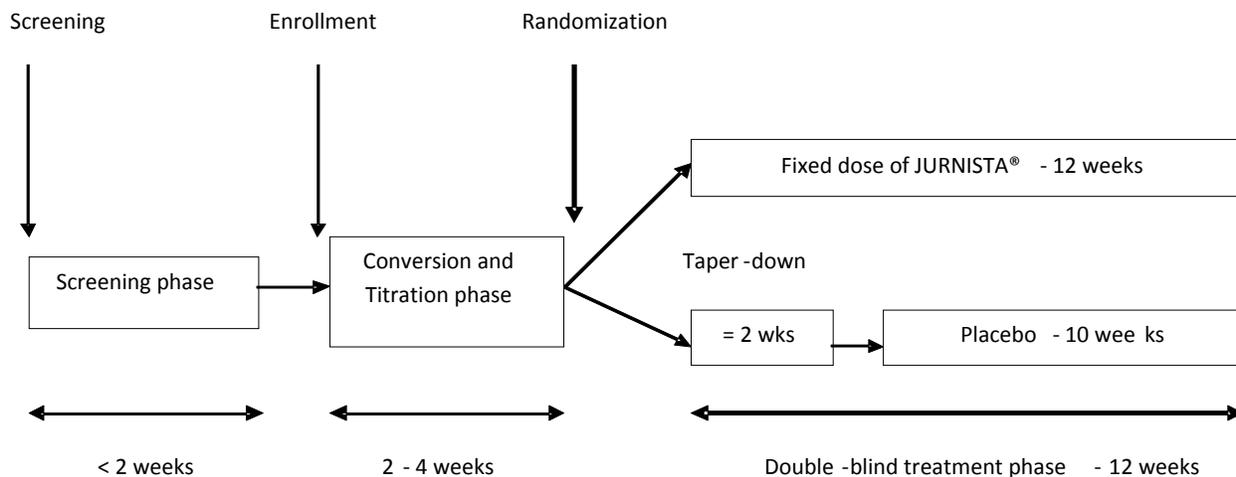

**Table 2.1: Summary of Patient Demographics for JURNISTA<sup>®</sup> Clinical Trials**

Study #	Trial design	Dosage, route of administration and duration	Study subjects (n = number)	Mean age (Range)	Gender
M03-644	Double-blind, fixed-dose, parallel-group, placebo-controlled study	Oral administration of JURNISTA <sup>®</sup> 8 mg, 16 mg, or placebo qd with 12 weeks double-blind treatment period	n = 981 (319 for 8 mg, 330 for 16 mg, 332 for placebo)	59 y (22, 89)	354 M 627 F
NMT 1077-301	Placebo-controlled, double-blind study with a conversion and titration phase (C&T), and a double-blind phase (DB)	Oral administration of JURNISTA <sup>®</sup> 12 to 64 mg, or placebo qd	C&T phase: n = 447; DB phase: n= 266 (ITT: 133 for JURNISTA <sup>®</sup> , 133 for placebo)	49.0 y (23,75)	C&T: 227 M, 220 F;  DB: 132 M, 134 F

### **Low Back Pain**

#### Study Demographics and Trial Design

JURNISTA<sup>®</sup> was investigated in Study NMT01077-301, a double-blind, placebo-controlled, randomized withdrawal study in 266 opioid tolerant patients with moderate to severe chronic Low Back Pain. Patients who were stabilized previously with an immediate release strong opioid entered an open-label conversion and titration phase with JURNISTA<sup>®</sup>. The starting dose for conversion was approximately 75% of their total daily morphine equivalent dose. Patients were dosed with JURNISTA<sup>®</sup> once daily until adequate pain control was achieved, balanced against acceptable adverse reactions. Patients who achieved a stable dose entered a 12-week, double-blind, placebo-controlled, randomized treatment phase. Mean daily dose at randomization was 37.8 mg/day (median 32.0 mg/day, range of 12 mg/day to 64 mg/day). During the double-blind treatment phase, patients randomized to JURNISTA<sup>®</sup> continued with the stable dose achieved in the conversion and titration phase of the study. Patients randomized to placebo received JURNISTA<sup>®</sup> and matching placebo in doses tapering from the stable dose achieved in conversion and titration. Immediate release HYDROMORPHONE was provided for analgesia rescue throughout the JURNISTA<sup>®</sup> Conversion and Titration phase and double-blind treatment phase.

The primary efficacy outcome parameter, change in mean pain intensity on the 11-point Numeric Rating Scale (NRS) from baseline to Week 12, was 0.2 (median, range -5, 5) on JURNISTA<sup>®</sup> versus 1.6 (median, range -3, 7) on placebo ( $p < 0.001$ ). Results from secondary outcome parameters based on change from baseline to Week 12, such as patient global assessment, and Roland Morris Disability Questionnaire were supportive. During the 12-week double-blind withdrawal study phase, the percentage of drop-outs was 66.9% in patients on placebo versus 50.4% in patient on JURNISTA<sup>®</sup> ( $p < 0.01$ ).

### Comparative Bioavailability Studies

Comparative bioavailability between JURNISTA<sup>®</sup> and Immediate-Release (IR) HYDROmorphone tablet has been evaluated in single- and multi-dose studies. To block the opioid effects of HYDROmorphone during study treatment, each subject received oral naltrexone 50 mg as an opioid antagonist in each treatment period.

**Study PAI-1008** was a randomized, open-label, three-way crossover study conducted in 30 healthy male and female adult subjects. This study assessed the relative bioavailability of HYDROmorphone following the oral administration of a daily dose of JURNISTA<sup>®</sup> (OROS<sup>®</sup> HYDROmorphone) 16 mg and DILAUDID<sup>®</sup> (IR HYDROmorphone) 4 mg q6h. Additionally, the effects of a high-fat meal on the pharmacokinetics of JURNISTA<sup>®</sup> 16 mg were also assessed.

The following table summarizes the pharmacokinetic parameters for JURNISTA<sup>®</sup> and IR HYDROmorphone under fasted condition.

JURNISTA <sup>®</sup> 16 mg qd HYDROmorphine IR 4 mg q6h From Measured Data Geometric Mean Arithmetic Mean (±SD)				
Parameter	JURNISTA <sup>®</sup>	IR HYDROmorphine	% Ratio of Geometric Means	90% Confidence Interval
AUC <sub>last</sub> (ng.h/mL)*	44.696	42.836	104.3	94.9 - 114.7
AUC <sub>∞</sub> (ng.h/mL)*	47.578	44.436	107.1	97.0 - 118.1
C <sub>max</sub> <sup>ε</sup> (ng/mL)	1.89 (0.484)	3.57 (1.46)		
T <sub>max</sub> <sup>§</sup> (h)	17.9 (6.01- 24.2)	18.5 (18.5-20.0)		
T <sub>1/2</sub> <sup>ε</sup> (h)	14.4 (6.04)	12.7 (3.43)		

\*AUC values are expressed as the geometric mean

§ Expressed as the arithmetic median (range)

ε Expressed as the arithmetic mean (SD)

The JURNISTA<sup>®</sup> and IR HYDROmorphine formulations administered under fasting conditions were bioequivalent with respect to AUC<sub>last</sub> and AUC<sub>∞</sub>. Additionally, the JURNISTA<sup>®</sup> formulation administered under fasting and fed conditions were bioequivalent with respect to C<sub>max</sub> and AUC.

**Study PAI-1009** was a randomized, open-label, multi-dose, two-way crossover study conducted in 29 healthy male and female adult subjects. This study assessed the steady-state relative bioavailability and pharmacokinetics of HYDROmorphine following oral administration of JURNISTA<sup>®</sup> (OROS<sup>®</sup> HYDROmorphine) 16 mg qd and DILAUDID<sup>®</sup> (IR HYDROmorphine) 4 mg q6h for five days. The following table summarizes the multiple-dose pharmacokinetic parameters for JURNISTA<sup>®</sup> and IR HYDROmorphine.

JURNISTA <sup>®</sup> 16 mg qd HYDROmorphine IR 4 mg q6h From Measured Data Geometric Mean Arithmetic Mean (±SD)				
Parameter	JURNISTA <sup>®</sup>	IR HYDROmorphine	% Ratio of Geometric Means	90% Confidence Interval
AUC <sub>0-t</sub> * (ng.h/mL) <sup>‡</sup>	55.677	52.915	105.2	99.9 – 110.8
C <sub>max,ss</sub> <sup>ε</sup> (ng/mL)	3.54 (0.959)	5.28 (1.37)		
C <sub>min,ss</sub> <sup>ε</sup> (ng/mL)	2.15 (0.872)	1.47 (0.417)		
C <sub>ave,ss</sub> <sup>ε</sup> (ng/mL)	2.40 (0.678)	2.28 (0.618)		
t <sub>max,ss</sub> <sup>§</sup> (h)	11.9 (5.92-24.2)	7.00 (0.500-18.8)

\*AUC values are expressed in geometric mean

ε Expressed as the arithmetic mean (±SD)

§ Expressed as median (range)

JURNISTA<sup>®</sup> 16 mg qd attained steady-state concentrations by Day 4 and was shown to maintain steady-state HYDROmorphine plasma concentrations within the same range as IR HYDROmorphine 4mg q6h tablets, although with reduced plasma level fluctuation.

## DETAILED PHARMACOLOGY

### Pharmacodynamics

HYDROmorphone is an opioid analgesic with ATC code: N02AA03.

HYDROmorphone hydrochloride is a hydrogenated ketone of morphine. *In vitro* assays demonstrate that HYDROmorphone binds to the opioid  $\mu$ -receptor with high affinity with  $K_i = 0.24$  nM, which is 7 times that of morphine ( $K_i = 1.8$  nM). In a comparison of the binding affinity to the  $\mu$ -receptor, the selectivity of HYDROmorphone is 60-fold versus the  $\delta$ -receptor, and 52-fold versus the  $\kappa$ -opioid receptor, while morphine binding affinity is 89-fold versus the  $\delta$ -receptor and 26-fold versus the  $\kappa$ -opioid receptor. Whereas analgesia appeared to correlate with  $\mu$ -binding affinity, activation of  $\kappa$ -receptors is considered to be responsible, among other adverse effects, for cardiac changes, such as arrhythmias during ischemia/reperfusion seen in the isolated rat heart.

### TOXICOLOGY

The potential toxicity of HYDROmorphone has been evaluated in single-dose, repeat-dose, mutagenicity, reproduction and developmental studies. The oral tolerability of JURNISTA<sup>®</sup> was evaluated in a repeat-dose study and the intravenous toxicity of the major polyethylene oxide excipients was evaluated in single and repeat dose studies.

### Single-Dose Toxicity

Summary of the acute toxicity studies is presented in the following table. The acute intoxication in rodents is characterised by respiratory depression and CNS depression in terms of sedation, agitation, effects on eyes as well as weakness and uncoordinated muscle movements.

**Table 2.2: Single-Dose Toxicity**

<b>Species (Strain) / Sex &amp; No./Dose Group</b>	<b>Duration / Route / Dose (mg/kg)</b>	<b>Noteworthy Findings / NOAEL<sup>a</sup> (mg<sup>#</sup>/kg)</b>
Mouse (NMRI) / 5M, 5F	Single dose/ Oral (gavage) 0, 46.4, 147, 215, 261	Straub tail, hyperactivity, stiff gait, rough coat, ataxia / M: 46.4, F: 147
Mouse (NMRI) / 5M, 5F	Single dose/ Intravenous / 0, 14.7, 21.5, 31.6, 46.4, 68.1, 100.0	Straub tail, hyperactivity, intermittent apathy, stiff gait, exophthalmos, clonic convulsions, ataxia / M: 46.4, F: 68.1
Rat (Wistar) / 5M, 5F	Single dose / Oral (gavage) / 0, 1.0, 10.0, 21.5, 31.6	Exophthalmos, opisthotonus, hyperphagia of bedding, lassitude, gnawing of tail / M: 10, F: 21.5
Rat (Wistar) / 5M, 5F	Single dose / Intravenous / 0, 1.0, 4.64, 6.81	Prone position, stiffness, lassitude, exophthalmos, flat respiration, impaired grip strength/pinna reflex/toe pinch reflex, red discoloration of paws, hyperactivity, compulsive grooming / M & F: 1.0

<sup>a</sup> NOAEL: No Observed Adverse Effect Level

<sup>#</sup> expressed as HYDROmorphone base

## **Repeat-Dose Toxicity**

### **HYDROmorphone**

In mice, repeated oral administration of HYDROmorphone resulted in increased activity, rough coat, Straub tail, inappetence and in females only, vocalization. Following repeat-dose administration to rats, there were no signs of respiratory depression; however, distinct symptoms of CNS depression predominated. In addition to the findings of acute intoxication, the animals showed abnormal behaviour (i.e. aggressiveness), inappetence (i.e. reduction of food consumption and body weight), and effects on eyes (i.e. mydriasis) and gastrointestinal tract (i.e. diarrhea), as well as rigid posture indicating uncoordinated muscle movements.

The frequently observed side effects in repeatedly dosed dogs included respiratory depression and CNS depression in terms of sedation, vomiting, salivation, abnormal behaviour, hypothermia, inappetence, effects on eyes and gastrointestinal tract, as well as uncoordinated muscle movements (i.e. imbalance, abnormal posture/recumbency or tremor). To a lesser degree, circulatory depression in terms of a decrease in blood pressure (probably due to peripheral vasodilation) and a compensatory increase in heart rate was also observed.

Following chronic administration of oral HYDROmorphone to rats (for at least 39 weeks), there were signs of tolerance to the treatment-related effects, but no symptoms of withdrawal were observed in the course of the study. A summary for the pivotal repeated-dose studies for HYDROmorphone is provided in Table 2.3.

### **OROS<sup>®</sup> HYDROmorphone: Gastrointestinal Tolerability**

The gastrointestinal tolerability of 30-day daily administration of OROS<sup>®</sup> HYDROmorphone was assessed in dogs in comparison with oral immediate-release HYDROmorphone at 64 mg/day. The OROS<sup>®</sup> HYDROmorphone dosage form was as equally well tolerated as immediate-release HYDROmorphone, at similar exposures, with no gastric irritation apparent.

### **Polyethylene Oxide: Excipient**

Polyethylene oxides, POLYOX<sup>™</sup> 200K and POLYOX<sup>™</sup> 2000K, are the major OROS<sup>®</sup> tablet excipients that provide the osmotic engine for the OROS<sup>®</sup> controlled-release mechanism. Both POLYOX 200K and POLYOX 2000K are metabolically inert and well tolerated by the oral route at doses up to 2000 mg/kg/day over extended periods of administration.

Due to the known potential for parenteral abuse of HYDROmorphone, in particular via the intravenous route, the toxicologic risk presented by inadvertent intravenous co-administration of the OROS<sup>®</sup> HYDROmorphone tablet polyethylene oxide excipients was investigated. When administered intravenously to rats, both forms of POLYOX were found to be poorly tolerated, while POLYOX 2000K caused mortality at the highest doses tested, supporting findings reported in literature. Both forms of POLYOX remained in the circulation at high concentrations for extended periods, consistent with their high molecular weights and lack of metabolic clearance pathway.

**Table 2.3: Repeat-Dose Toxicity**

Species and Strain/ Sex / No./Group	Duration of Dosing / Method of Administration/ Doses <sup>#</sup> (mg/kg) or (units) <sup>#</sup>	Noteworthy Findings / NOAEL <sup>a</sup> (mg/kg)
Rat (Wistar) / 10M, 10F	4 weeks / Oral (gavage) / 0, 3.5, 7.0, 14.0	No mortality. In all dose groups, M & F: signif. decrease in body weight change; non-signif. decrease in food consumption; neurobehavioural clinical signs including hyperactivity, compulsive chewing; at 7 mg/kg and above, exophthalmus; at 14 mg/kg, alopecia and ophthalmic observations 9/10M, 4/10F. From 3.5 mg/kg in M & F, signif. decreased triglycerides and urea; increased bilirubin. From 3.5 mg/kg: signif. increased (M > F) organ weights over controls: brain, heart, liver, adrenal glands, testes (M), decreased thymus. No significant effects in 4-week recovery group. / M, F: 3.5
Rat (Wistar) / 20M, 20F	27 weeks / Oral (gavage) / 0, 3.5, 7.0, 14.0	One M died in each of 3.5 and 14 mg/kg groups. In all dose groups, M & F: decrease in body weight change (M > F); neurobehavioural clinical signs including hyperactivity, compulsive chewing; self-mutilation, sedation, lassitude, mydriasis, diarrhea, exophthalmus, alopecia, rough coat; from 7.0 mg/kg, aggressiveness, rigid posture, and increased ophthalmic observations (lens opacities). From 3.5 mg/kg in M > F, occasional signif. increased K, decreased Na, Ca, protein, triglycerides. From 3.5 mg/kg: signif. increased (M > F) organ weights over controls: brain, heart, liver, adrenal glands, testes (M). From 3.5 mg/kg, gross pathology showed hepatocellular atrophy in M with increasing incidence, retinal atrophy; from 7 mg/kg minimal adnexal atrophy; at 14 mg/kg lungs showed granulomas, confirmed histopathologically. Occasional increased organ weights remained significant effects in recovery group. / M, F: 3.5
Dog (Beagle) / 4M, 4F	30 days / Oral JURNISTA <sup>®</sup> (tablets) / 0, 8, 64 mg/animal DILAUDID <sup>®</sup> (tablets) / 64 (2 x 32) mg/animal	One F dosed with Dil-IR died. Dil-IR M & F: excess salivation; increased fasting glucose. In F in all groups and M at 64 mg OHM and Dil-IR, vomiting, unformed stool, decreased activity, tremors, ophthalmoscopy findings. / M, F: 8
Dog (Beagle) / 4M, 4F	4 weeks / Oral (capsules) / 0, 1.75, 3.5, 7	No mortality. From 1.75 mg/kg, F: signif. decreased body weight. At 7 mg/kg, week 4, M & F: signif. decreased mean arterial blood pressure, increased heart rate; sl. increased Na; increased CL. At 7 mg/kg, M: signif. decreased spleen weight. In gross pathology, from 3.5 mg/kg: diminished size thymus; enlarged adrenals, liver; at 7.0 mg/kg: diminished size prostate; emaciation/dehydration noted. At 7 mg/kg histopathology showed increased gastric mucus, focal adrenocortical hypertrophy, increased cortical atrophy. / M, F: 3.5
Dog (Beagle) / 7M, 7F	39 weeks / Oral (capsules) / 0, 1.75, 4.0, 9	No mortality. From 1.75 mg/kg, M & F: clinical observations of sedated, foamy salivation, incomplete food consumption, ventral recumbency. At week 38, from 1.75 mg/kg, M & F: signif. increased glucose; decreased ALT (except 1.75 & 4 mg/kg M). From 4.0, M: signif. increased pituitary gland weight. From 1.75, M & F: histopathology showed many observations in 1 or 2 animals, with no clear dose-related pattern of incidence except granulocytic infiltrates in kidneys observed in 3-4 animals per group. / M, F: 9

<sup>a</sup> NOAEL: No Observed Adverse Effect Level

<sup>#</sup> Doses in mg of HYDROmorphone base

## **Mutagenic Potential**

HYDROmorphone under *in vitro* and *in vivo* conditions was neither mutagenic nor clastogenic. Details of the studies are provided in Table 2.4.

**Table 2.4: Genotoxicity**

<b>Type of Test / Species and Strain / No./Group</b>	<b>Duration of Dosing / Method of Administration / Concentrations (units) / Doses (mg/kg) #</b>	<b>Noteworthy Findings</b>
Ames Test: Reverse Mutation Assay / <i>Salmonella typhimurium</i> (TA98, TA100, TA1535, TA1537)	<i>In vitro</i> / 100–5000 µL/plate	No mutagenicity No cytotoxic effects
Ames Test: Reverse Mutation Assay / <i>Salmonella typhimurium</i> (TA98, TA100, TA1535, TA1537, TA102)	<i>In vitro</i> / 33–5000 µL/plate	No mutagenicity Assay #1: Slight effects without S9 mix in TA100 at 5000 µg/plate Assay #2: Slight effects without S9 mix in TA1537 at 5000 µg/plate
Chromosome Aberration Test / Human lymphocytes /	Single dose / Oral (gavage) / 400–3200 µg/mL	No mutagenicity or clastogenicity Assay #1: Only slightly reduced mitotic index (MI) at top dose without S9 mix (3200µg/mL). Assay #2: Distinctly reduced MI after 22.5h and 46h continuous treatment without S9 mix only observed at 1600 µg/mL.
Micronucleus Assay/ Mouse (NMRI) / 6M, 6F	Single dose / Oral (gavage)/ 10, 33.3, 100 (mg/mL)	No genotoxicity effects observed MTD: 100 mg/kg, 3/24 animals died prematurely at this dose. Cytotoxic effect only at 100 mg/kg at 48h.

# Doses in mg of HYDROmorphone base

## **Carcinogenesis and Mutagenesis**

Long-term studies to evaluate the carcinogenic potential of hydromorphone hydrochloride were completed in both Han-Wistar rats and CrI:CD1<sup>®</sup> (ICR) mice. Hydromorphone HCl was administered to Han-Wistar rats (0, 2, 5, and 15 mg/kg/day for males, and 0, 8, 25 and 75 mg/kg/day for females) for 2 years by oral gavage. In female rats, combined incidences of benign and malignant hibernoma (tumour of brown fat) were not seen at 0 mg/kg/day and at 8 mg/kg/day, but were increased at 4.2 times the maximum recommended human daily exposure based on AUC at the mid dose (2 tumours, 25 mg/kg/day) and 21.7 times the maximum recommended human daily exposure based on AUC at the maximum dose (4 tumours, 75 mg/kg/day). In male rats, the combined incidences of benign and malignant hibernomas were observed at 0 mg/kg/day (2 tumours); 2 mg/kg/day (1 tumour); 5 mg/kg/day (2 tumours); and 15 mg/kg/day (0 tumours). The clinical relevance of these rodent brown fat tumours to humans has not been established. The systemic drug exposure (AUC, ng•h/mL) at the 15 mg/kg/day in male rats was 3.1 times greater than the human exposure after a single 64 mg dose of JURNISTA<sup>®</sup>. There was no evidence of carcinogenic potential in CrI:CD1<sup>®</sup> (ICR) mice administered hydromorphone HCl at doses up to 15 mg/kg/day for 2 years by oral gavage (0, 1.5, 5 and 15 mg/kg/day for both males and females). The systemic drug exposure (AUC, ng•h/mL) at the 15 mg/kg/day in mice was 0.4 (in males) and 0.5 (in females) times the human exposure at a single

64 mg dose of JURNISTA<sup>®</sup>. Full microscopic examination was carried out for all mice and rats in only the control and high dose groups.

### **Reproduction and Developmental Studies**

In reproductive and developmental studies in rats and rabbits, no effects on male or female fertility or sperm parameters were observed in rats at oral HYDROmorphine doses of up to 6.25 mg/kg/day. No effect was observed on female reproductive parameters at oral doses of up to 25 mg/kg/day in rabbits, or 3.13 mg/kg/day in rats. In rats, a slight but statistically significant reduction in implantations was observed at 6.25 mg/kg/day, a dose level that produced maternal toxicity (weight loss) during the mating period. There was no evidence of teratogenicity or toxicity to the developing rat fetus at oral doses of 6.25 mg/kg/day. Plasma exposure (AUC) to HYDROmorphine at this dose level was 135 ng.hr/mL, approximately 1.5 times the human exposure (AUC) based on the median daily dose. Neonatal viability and survival was reduced in preweaning rats, at the maternal oral daily dose of 6.25 mg/kg. The latter appears to be a class effect of an opioid analgesic. In view of the demonstrated ability of HYDROmorphine to cross the placental barrier in rats and rabbits and to be excreted in breast milk of rats and humans, HYDROmorphine (and also other morphine-like drugs) should not be used during labour or in nursing mothers. Reproduction and teratology studies are summarized in Table 2.5.

**Table 2.5: Reproductive and Developmental Toxicity**

Type of Study / Species (Strain) / No./Group	Duration of Dosing / Method of Administration / Doses (mg/kg) <sup>#</sup>	Noteworthy Findings / NOAEL <sup>a</sup>
Segment I: Fertility and Early Embryonic Development / Rat (Sprague-Dawley) / 20M, 20F	Males: 28 days pre mating Females: 14 days pre mating to 7 <sup>th</sup> day of gestation / Oral (gavage) / 0, 1.56, 3.13, 6.25	<u>Males</u> : no mortalities. From 1.56 mg/kg: increased restlessness, motor activity and self-mutilation. From 3.13 mg/kg: loss of hair; decreased body weight; slight decrease in spermatids/g testicular tissue. <u>Females</u> : no mortalities. From 1.56 mg/kg: increased restlessness, motor activity. From 3.13 mg/kg: loss of hair; decreased body weight, pre mating & gestational. At 6.25 mg/kg: decreased: mean no. corpora lutea; signif. mean no. implantations; mean no. live conceptuses; NOAEL F <sub>0</sub> M: <1.56 mg/kg; NOAEL F <sub>0</sub> F: <1.56 mg/kg; NOAEL F <sub>1</sub> litters: 3.13 mg/kg
Segment II: Effects on Embryofetal Development / Rat (Sprague-Dawley) / 20F	Females: 11 days (6 <sup>th</sup> to 17 <sup>th</sup> day of gestation) / Oral (gavage) / 0, 1.56, 3.13, 6.25	No mortalities. No fetal abnormalities. From 1.75 mg/kg: signif. decreased body weight, pre mating & gestational. From 3.13 mg/kg: signif. increased restlessness, motor activity, loss of hair; signif. decreased food consumption. At 6.25 mg/kg: signif. decreased mean no. implantations; increased mean % post-implantation loss. NOAEL F <sub>0</sub> F: 1.56 mg/kg; NOAEL F <sub>1</sub> litters: 3.13 mg/kg
Segment II: Effects on Embryofetal Development (non-pivotal) / Rabbit (Himalayan) / 2F (both pregnant)	Females: 14 days (6 <sup>th</sup> to 20 <sup>th</sup> day of gestation) / Oral (gavage) / 0, 1.56, 3.13, 6.25, 12.5	No mortality in dams; no fetal abnormalities. From 1.56 mg/kg: decreased body weight; decreased food consumption. At 12.5 mg/kg: increased resorptions; increased % mean pre-implantation loss; decreased fetal body weight. NOAEL F <sub>0</sub> F: 12.5 mg/kg; NOAEL F <sub>1</sub> litters: >12.5 mg/kg
Segment II: Effects on Embryofetal Development / Rabbit (Himalayan) / 20F	Females: 14 days (6 <sup>th</sup> to 20 <sup>th</sup> day of gestation) / Oral (gavage) / 0, 6.25, 12.5, 25	No mortality in dams; no dose-related fetal abnormalities. From 12.5 mg/kg: reduced motility. At 25 mg/kg: abdominal position, mydriasis, sedation; signif. decreased body weight; signif. decreased food consumption. From 12.5 mg/kg: increased mean % preimplanation loss; decreased fetal body weight. NOAEL F <sub>0</sub> F: 6.25 mg/kg; NOAEL F <sub>1</sub> litters: 25 mg/kg
Segment III: Effects Pre- and Postnatal Development Including Maternal Function / Rat (Sprague-Dawley) / 20F	Females: 27 days (6 <sup>th</sup> day of gestation to 21 <sup>st</sup> day of lactation) / Oral (gavage) / 0, 1.56, 3.13, 6.25	F <sub>0</sub> : One mortality each at 1.56 and 6.25 mg/kg. No abnormal parturition. From 1.56 mg/kg: thin fur. At 3.13 mg/kg: self-mutilation; signif. decreased gestational body weight and food consumption, and lactational food consumption. F <sub>1</sub> litters (preweaning), at 6.25 mg/kg: signif. decreased viability index - mean litter index (%) and overall survival - mean litter index (%); M & F: signif. decreased Day 1 mean body weights. F <sub>1</sub> pups: no clinical signs and no abnormalities; F <sub>2</sub> : No fetal abnormalities NOAEL F <sub>0</sub> F: <1.56 mg/kg ; NOAEL F <sub>1</sub> litters: 1.56 mg/kg; NOAEL F <sub>2</sub> litters: 6.25 mg/kg

<sup>a</sup> NOAEL: No observed adverse effect level

**READ THIS FOR SAFE AND EFFECTIVE USE OF YOUR MEDICINE**

**PATIENT MEDICATION INFORMATION**

**<sup>N</sup>JURNISTA<sup>®</sup>**

**HYDROMORPHONE hydrochloride Prolonged Release Tablets**

Read this carefully before you start taking **JURNISTA<sup>®</sup>** and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about **JURNISTA<sup>®</sup>**.

**Serious Warnings and Precautions**

- **Even if you take **JURNISTA<sup>®</sup>** as prescribed you are at risk for opioid addiction, abuse, and misuse that can lead to overdose and death.**
- **Life-threatening breathing problems can happen while taking **JURNISTA<sup>®</sup>**, especially if not taken as directed.**
- **Never give anyone your **JURNISTA<sup>®</sup>**. They could die from taking it. If a person has not been prescribed **JURNISTA<sup>®</sup>**, taking even one dose can cause a fatal overdose. This is especially true for children.**
- **Babies born to mothers who have taken **JURNISTA<sup>®</sup>** (for short or long periods, in small or large doses) at the end of their pregnancy can suffer life-threatening withdrawal symptoms. This can occur in the days after birth and for up to 4 weeks after delivery. If your baby has breathing changes (weak, difficult or fast), is unusually difficult to comfort, has tremors (shakiness), or has increased stools, sneezing, yawning, vomiting, or fever, seek immediate medical help for your baby.**

**What is **JURNISTA<sup>®</sup>** used for?**

**JURNISTA<sup>®</sup>** is used for the long-term management of pain, when:

- the pain is severe enough to require daily, around-the-clock painkillers
- the doctor determines that other treatment options are not able to effectively treat your pain

**JURNISTA<sup>®</sup>** is NOT used (“as needed”) to treat pain that you only have once in a while.

**How does **JURNISTA<sup>®</sup>** work?**

**JURNISTA<sup>®</sup>** is a painkiller belonging to a class of medicines known as opioids. It relieves pain by acting on specific nerve cells of the spinal cord and brain.

**If you continue to have pain, call your doctor.**

Always follow your doctor's instructions carefully and do not change or stop your JURNISTA<sup>®</sup> medication without first consulting with your doctor.

**What are the ingredients in JURNISTA<sup>®</sup>?**

Medicinal ingredients: HYDROmorphine hydrochloride

Non-medicinal ingredients: butyl hydroxytoluene, cellulose acetate, glycerol triacetate (8 mg, 16 mg and 32 mg only), ferric oxide red (4 mg and 8 mg only), ferric oxide yellow (4 mg, 16 mg, and 32 mg only), hypromellose, iron oxide black, lactose anhydrous, lactose monohydrate (8 mg, 16 mg and 32 mg only), macrogol, magnesium stearate, polyethylene oxide, povidone, propylene glycol, sodium chloride and titanium dioxide

JURNISTA<sup>®</sup> may contain traces of sodium metabisulfite.

**JURNISTA<sup>®</sup> comes in the following dosage forms:**

4 mg, 8 mg, 16 mg, and 32 mg prolonged-release tablets in hard non-dissolvable shells.

**Do not use JURNISTA<sup>®</sup> if:**

- you are allergic (hypersensitive) to HYDROmorphine hydrochloride or any of the other ingredients of JURNISTA<sup>®</sup>
- your pain can be controlled by the occasional use of painkillers including those available without a prescription
- you have severe asthma, trouble breathing or other lung problems
- you have bowel blockage or narrowing of the stomach or intestines
- you have had surgery or medical conditions which may have left you with narrowing or “blind loops” in your intestine
- you get sudden severe pain in your abdomen and the cause has not been diagnosed
- you suffer from alcoholism
- you have a head injury or other risks for seizures
- are going to have, or recently had, a planned surgery
- you are also taking MAO inhibitors (certain medicines used for treatment of depression) or have taken them in the last 14 days before treatment with JURNISTA<sup>®</sup>
- you are pregnant or plan to become pregnant, breast-feeding, or in labour
- you have a rare inherited disease which affects how your body uses the sugar lactose (because lactose is an ingredient in JURNISTA<sup>®</sup>)
- you are under 18 years of age

**To help avoid side effects and ensure proper use, talk to your healthcare professional before you take JURNISTA<sup>®</sup>. Talk about any health conditions or problems you may have, including if you:**

- have any other medical conditions (such as difficulty urinating or breathing or problems with your heart, lungs, brain, liver, hormones, or kidney)
- have inflammatory bowel disease, bowel obstruction, gallbladder disease or bile duct disease

- have problems with your pancreas
- have a history of illicit or prescription drug or alcohol abuse
- you have chronic and severe constipation
- have severe kidney, liver or heart disease
- have low blood pressure
- have problems with your thyroid, adrenal or prostate gland

**Other warnings you should know about:**

**Driving and using machines:** Before you perform tasks which may require special attention, wait until you know how you respond to JURNISTA<sup>®</sup>. Drowsiness, dizziness, or lightheadedness, can especially occur after the first dose and when the dose is increased.

**Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.**

**The following may interact with JURNISTA<sup>®</sup>:**

- alcohol, including prescription and non-prescription medications containing alcohol. Do not drink alcohol while taking JURNISTA<sup>®</sup>. This can lead to drowsiness, depressed breathing, serious side effects or a fatal overdose
- other sedative drugs which may enhance the drowsiness caused by JURNISTA<sup>®</sup>
- other opioid analgesics (for pain)
- general anesthetics (used during surgery)
- benzodiazepines (used to help you sleep or to reduce anxiety)
- illegal drugs
- antidepressants (for depression and mood disorders). Do not take JURNISTA<sup>®</sup> with MAO inhibitors or if you have taken MAOI's in the last 14 days before treatment with JURNISTA<sup>®</sup>
- drugs used to treat serious mental or emotional disorders such as schizophrenia
- antihistamines (for allergies)
- anti-emetics (for prevention of vomiting)
- drugs used to treat muscle spasms and back pain
- some heart medication (beta-blockers)

**How to take JURNISTA<sup>®</sup>:**

**Swallow whole.** Do not break, chew, dissolve or crush as it would cause too much drug to be released into your blood at one time and expose yourself to a potentially toxic dose of hydromorphone.

**Usual Adult Starting Dose:**

Dosage is individualized. Be sure to follow your doctor's dosing instructions exactly.

Take JURNISTA<sup>®</sup> once a day as directed by your doctor. JURNISTA<sup>®</sup> tablets should be taken whole at approximately the same time each day with a glass of water. JURNISTA<sup>®</sup> has a hard, non-dissolvable shell. Do not be alarmed if you notice what appears to be the JURNISTA<sup>®</sup> tablet in your stools, as it is simply the shell.

**Overdose:**

Early signs of overdose may include abnormally slow or weak breathing, dizziness, confusion or extreme drowsiness or sedation, tiredness, inability to think, talk or walk normally, feeling faint, clammy skin, small pupils or low blood pressure. The effects can get worse and lead to coma (unconsciousness), respiratory failure and death.

If you think you have taken too much JURNISTA<sup>®</sup>, contact your healthcare professional, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

**Missed dose:**

If you miss one dose, take it as soon as possible. However, if it is almost time for your next dose, then skip the missed dose. Do not take two doses at once. If you miss several doses in succession, talk to your doctor before restarting your medication.

**Discontinuation of JURNISTA<sup>®</sup>:**

Please do not suddenly stop taking JURNISTA<sup>®</sup> as it may cause unwanted side effects such as nausea, vomiting, diarrhea, anxiety and shivering. Your doctor can discuss the best way for you to stop taking JURNISTA<sup>®</sup>.

**Refilling Prescriptions for JURNISTA<sup>®</sup>:**

A new written prescription is required from your doctor each time you need more JURNISTA<sup>®</sup>. Therefore, it is important that you contact your doctor before your current supply runs out.

**What are possible side effects from using JURNISTA<sup>®</sup>?**

These are not all the possible side effects you may feel when taking JURNISTA<sup>®</sup>. If you experience any side effects not listed here, contact your healthcare professional.

Side effects may include:

- Drowsiness, insomnia
- Dizziness, fainting
- Nausea, vomiting, poor appetite, dry mouth
- Headache
- Problems with vision
- Weakness, uncoordinated muscle movement
- Itching, skin burning sensation
- Sweating

- Constipation
- Heartburn

Talk with your doctor or pharmacist about ways to prevent constipation when you start using JURNISTA®.

Serious side effects and what to do about them			
Symptom / effect	Talk to your healthcare professional		Stop taking drug and get immediate medical help
	Only if severe	In all cases	
<b>RARE</b> <b>Overdose:</b> hallucinations, confusion, inability to walk normally, slow or weak breathing, extreme sleepiness, sedation, or dizziness, floppy muscles/low muscle tone, cold and clammy skin.			✓
<b>Respiratory Depression:</b> slow, shallow or weak breathing.			✓
<b>Allergic Reaction:</b> rash, hives, swelling of the face, lips, tongue or throat, difficulty swallowing or breathing.			✓
<b>Bowel Blockage (impaction):</b> abdominal pain, severe constipation, nausea.			✓
<b>Withdrawal:</b> nausea, vomiting, diarrhea, anxiety, shivering, cold and clammy skin, body aches, loss of appetite, sweating.		✓	
<b>Fast, Slow or Irregular Heartbeat:</b> heart palpitations.		✓	
<b>Low Blood Pressure:</b> dizziness, fainting, light-headedness.	✓		

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, talk to your healthcare professional.

### **Reporting Side Effects**

You can help improve the safe use of health products for Canadians by reporting serious and unexpected side effects to Health Canada. Your report may help to identify new side effects and change the product safety information.

#### **3 ways to report:**

- Online at MedEffect<sup>®</sup> ([www.healthcanada.gc.ca/medeffect](http://www.healthcanada.gc.ca/medeffect));
- By calling 1-866-234-2345 (toll-free);
- By completing a Consumer Side Effect Reporting Form and sending it by:
  - Fax to 1-866-678-6789 (toll-free), or
  - Mail to: Canada Vigilance Program  
Health Canada, Postal Locator 1908C  
Ottawa, ON  
K1A 0K9

Postage paid labels and the Consumer Side Effect Reporting Form are available at MedEffect<sup>®</sup> ([www.healthcanada.gc.ca/medeffect](http://www.healthcanada.gc.ca/medeffect)).

*NOTE: Contact your healthcare professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.*

#### **Storage:**

**Keep unused or expired JURNISTA<sup>®</sup> in a secure place to prevent theft, misuse or accidental exposure. Keep out of sight and reach of children and pets.**

Store JURNISTA<sup>®</sup> between 15 and 25°C.

#### **Disposal:**

**JURNISTA<sup>®</sup> should never be thrown into household trash, where children and pets may find it.** It should be returned to a pharmacy for proper disposal.

#### **If you want more information about JURNISTA<sup>®</sup>:**

- Talk to your healthcare professional
- Find the full product monograph that is prepared for healthcare professionals and includes this patient medication information by visiting the Health Canada website ([www.healthcanada.gc.ca](http://www.healthcanada.gc.ca)); the manufacturer's website [www.janssen.com/canada](http://www.janssen.com/canada), or by calling 1-800-567-3331 or 1-800-387-8781.
